According to John von Neumann's game theory, the optimal technique for a series of random matches is the **Nash Equilibrium**: randomize options evenly (33.3% Rock, 33.3% Paper, 33.3% Scissors) over the long term. If both gamers play this technique completely, the game ends up being completely luck-based, and the expected worth for both gamers is absolutely no.

Nevertheless, people are essentially incapable of true randomness. This human defect is where bettors discover their edge.
