Frequently Asked Questions

What should I do if something does not match the app description?

Stop before entering passwords or granting more access. Recheck the filename, package, version, source page, and permissions. If the mismatch remains, remove the file or app and choose a clearer source instead of forcing the install.

When should I remove an app instead of trying more fixes?

Remove it when the app shows behavior you do not trust, asks for access you cannot justify, repeatedly fails, or creates more trouble than value. Back up data you need first, then uninstall it and review leftover files.

Can install-unknown-apps settings affect whether an APK works on my phone?

Yes. App behavior can depend on Android version, processor type, free storage, package history, and the way the build was made. A file that works on one phone may fail on another, so compare the app requirements with your own device.

Is one security check enough before installing an APK?

No. A scan or warning system can help, but it cannot answer every question about source quality, permissions, compatibility, or later behavior. Use several simple checks together and pay attention to anything that does not fit.

Should I keep the APK file after installation?

You do not have to keep every installer. Once you know the app works and you have any backup you need, removing old APK files can save space. Keep a file only when you have a clear reason and know where it came from.
